Background research, meeting prep, design process

17/11/21

1. Found an article about the IoT statistics. Have to ask Kevin if it's an appropriate article, because I have only seen research papers like the ones I am reading to have cited similar research papers.
2. Wrote a paragraph of the Background research sections using a couple of sources Kevin linked.

Choosing software language

11/22/2021

Read an article on differences between Go and Rust, two languages my mentor mentioned coding on.

Decided to use Rust because:

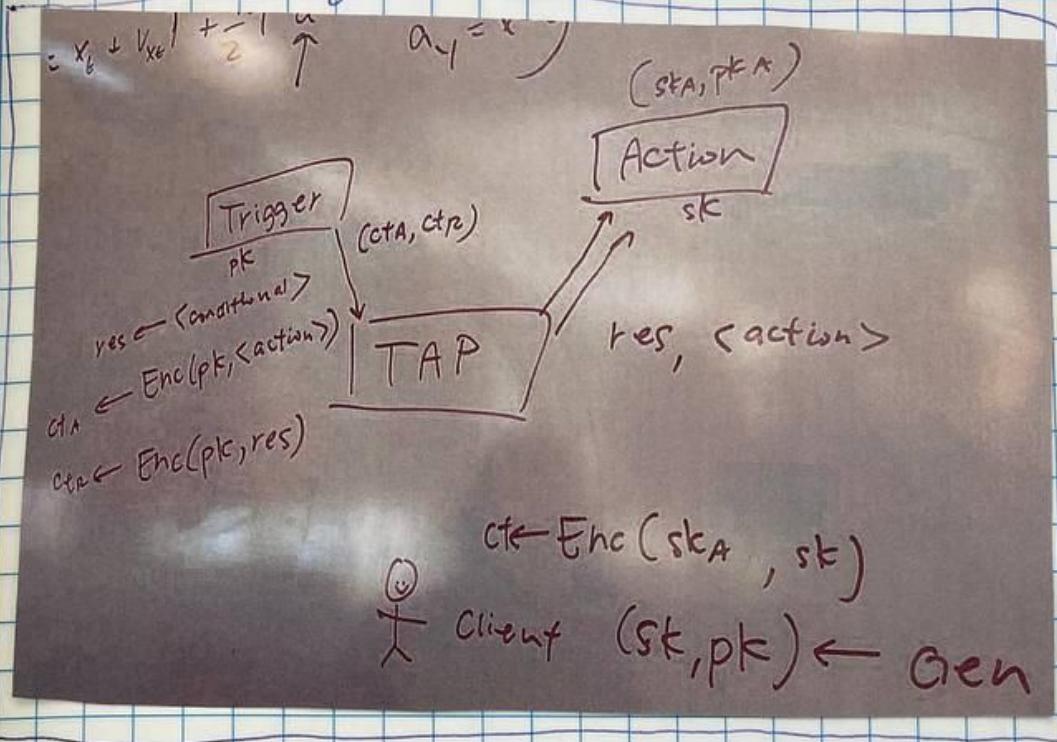

- very fast if you code really well, you can even reach almost full potential of the hardware
- many more features than in Go
- extensive support system w. guides, videos, users..
- if needed concurrency (like in Go), can be done manually
- ensures high safety, the compiler finds every possible minute bug (which is what we need)
 - Rust gives us the ability to say that we own a specific piece of data; It's not possible for anything else to claim ownership, so we know nothing else will be able to modify it.
- efficient code = you don't write much to do much
- Rust is more suitable for research, and Go is a better go-to for companies and bigger teams
- Go's garbage collection is questionable, and we don't need unnecessary uncertainty
- people say they hugely learned Go in two days so if sth goes very badly, we can switch in no time

* (1) Q: do we take advantage of parallel computations?

Aug 11/22/2021

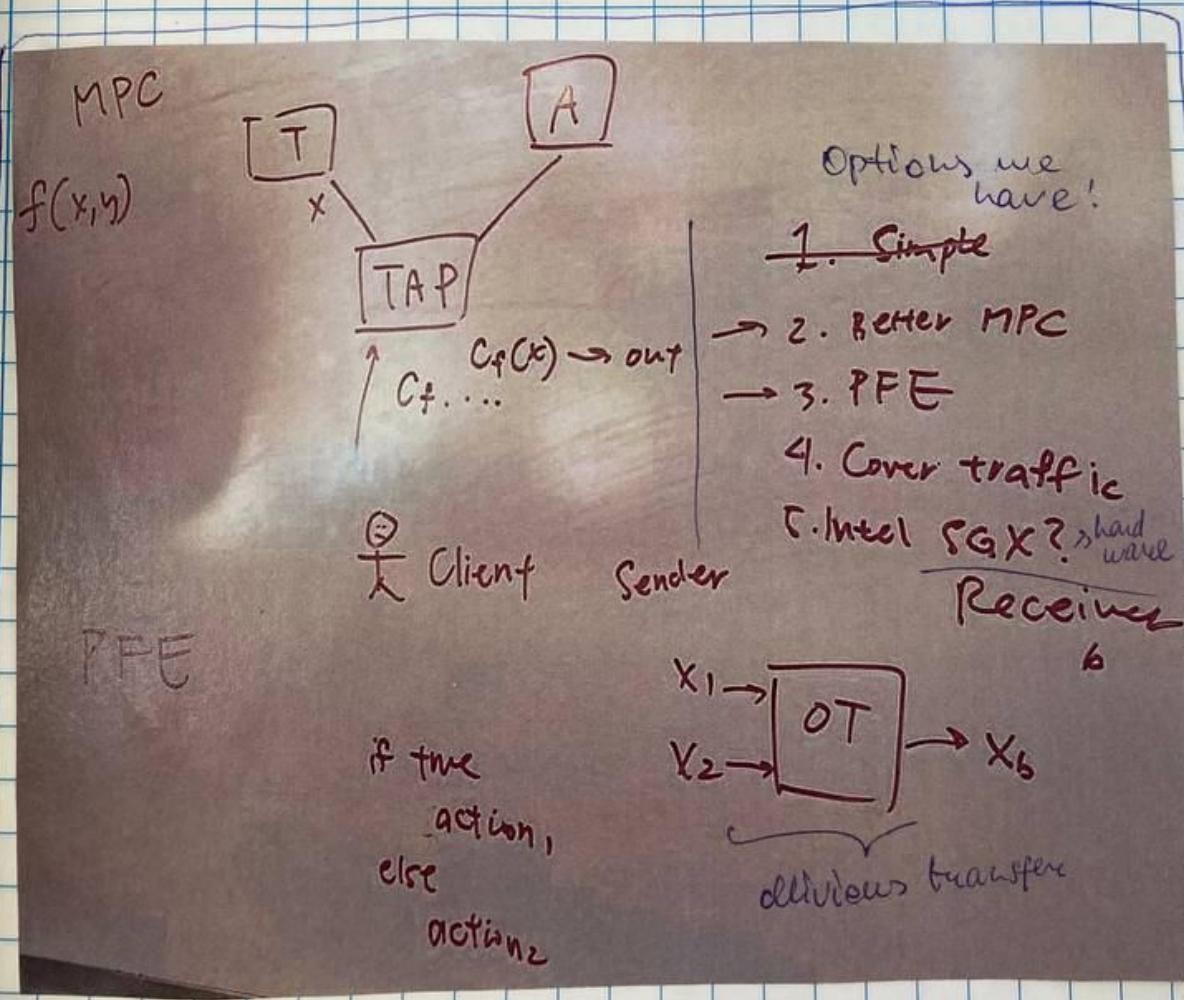

Mentor meeting 11/23/2021

11/23/2021

→ MPC
(2)

1 → let the TAP do all the work (computation) X

Mentor meeting 11/23/2021 (continuation)

11/23/2021

1. Simple is a bit dangerous, I think, because Chen et al. paper warned against it.
- 2 or 3 is a probable way to go
- 4 is an add-on
- 5 is an add-on

They are not mutually exclusive except 2 and 3

*Q (01) page 08: crypto uses mostly sequential flow, so concurrency does not really matter.

TO-DO's:

- print out two papers Kevin gave me access to
- Read on PFE
- use ifftt for services
- fix bibtex for two articles I've added to the paper
- continue background and finish everything I know by Wednesday's meeting (?)
for this week
for sure
- keep learning Rust and crypto course
- Read articles in the lit section

Rufy 11/23/2021

Mentor Meeting 12/01/2021

12/01

User sets the polling interval in IFTTTP.
investigate!

PFE - how slow is low?

→ a lot worse
than MPC

public circuit for MPC

PFE: one party has a private circuit
and another one its inputs

hide gates like XOR, and, OR, etc.

nothing goes into the trigger source

Figure in LaTeX - learn to do !!!

if $f_1(x, c_1)$ then $\underbrace{(f_2(x, c_2)) \rightarrow \text{action}}$
if $\underbrace{\text{email "confidential"}}$ $\underbrace{\text{[MPC] hence}}$

$f_2(x, c_2) \rightarrow \text{"text the email to my number"}$
 c_2 -number

TAP: shouldn't learn x , c_1 , c_2 , and results?

TS: shouldn't learn c_1 , c_2

AS: x , c_1 , c_2 ?

argue with the datasets, M

People are mostly executing the function the API
is capable of doing

c_1 is not sensitive → least to TS because we
already know +

but a lot of performance? ✓ saves a lot of
computations

mentor meeting 12/01 (continuation)

12/01

PFE might be too much in conjunction
with MPC

storage / costs

TAP: circuits for f_2 by client,
triggers and actions

- for each service, set of f_1 s and f_2 s

- when it polls, send $c_1 \rightarrow$ ciphertext

TS: all inputs
computes $f(x, c_1)$ with c_1

MPC

AS:

gets the outputs of $f_2(x, c_2)$
participate in MPC (not expensive)

where do we access the API?

What are the metrics we care about?

- Client: computation, communication to TAP

test through E2E pulse and average it) the data transnotated
we want to get lower

- TS: computation and communication to TAP

computation of $f_1(x, c_1)$ in plaintext vs
generating EC input for x

communication decreases, sends encryption of a bit

- AS: decrypt $f_2(x, c_2)$

- Motivate that c_1 does not need to be
hidden \downarrow find a real-world example

Coding a Web-Server in Rust: Single-Threaded

01/12/22

So, I need to learn to code in Rust, a completely new language to me. There is a book on doc.rust-lang.org about all the things I need to know to work with it on a high level.

My mentor, Kevin, sent me a chapter on coding a multithreaded web-server that uses HTTP and TCP/IP protocols for me to practice implementing them for the future, when we actually build the network connections in our TAP.

Today, I woke up early and did some work on the first step of coding a single-threaded server.

```

⑧ main.rs M X 404.html  hello.html
Users > veronikakitsul > Desktop > TAP-research > rust > server > src > main.rs
1 use std::io::prelude::*;
2 use std::net::TcpListener;
3 use std::net::TcpStream;
4 use std::fs;
5
6 fn main() {
7     let listener = TcpListener::bind("127.0.0.1:7878").unwrap();
8
9     for stream in listener.incoming() {
10         let stream = stream.unwrap();
11
12         handle_connection(stream);
13     }
14 }
15
16 fn handle_connection(mut stream: TcpStream) {
17     let mut buffer = [0; 1024];
18     stream.read(&mut buffer).unwrap();
19
20     let get = b"GET / HTTP/1.1\r\n";
21
22     let (status_line, filename) = if buffer.starts_with(get) {
23         ("HTTP/1.1 200 OK", "hello.html")
24     } else {
25         ("HTTP/1.1 404 NOT FOUND", "404.html")
26     }
27
28     let contents = fs::read_to_string(filename).unwrap();
29
30     let response = format! {
31         "{}\r\nContent-Length: {}\r\n{}\r\n",
32         status_line,
33         contents.len(),
34         contents
35     };
36
37     stream.write(response.as_bytes()).unwrap();
38     stream.flush().unwrap();
39 }

```

01/12/22
Rust -

Mentor Meeting 01/12/2022

Mentor meeting 01/19/2022 → Rust

01/19

anonymous sending: OAuth tokens

code for a TCP server that will listen to messages in the loop:

different message types

struct → marshalling data

{
 type
 --.
}

→ stuffing a struct into a network packet

packages about it

send message

↓ create message

[crypto packages] → Rust

encryp \leftrightarrow decrypt

Benchmarking package → Kevin will send it

All the steps:

→ design on paper + guarantees

→ run MPC lib

→ trigger service

→ TAP: let specify the rules

→ action service

→ connect them all

→ client: crypto code

wait for more resources from Kevin

Any 01/19

Rust Web-Server! Graceful shutdown and cleanup 08/23/22

Today, I'm finishing up coding a web-server through
Rust textbook. xc code attached on the next pages!

The screenshot shows a file explorer with a project named 'SERVER'. Inside 'src' are 'main.rs' and 'lib.rs'. In 'bin' are 'main.rs', 'lib.rs', 'target', '404.html', and 'Cargo.lock'. The 'Cargo.toml' file is also visible. The 'main.rs' file is selected and shown in the editor.

```

EXPLORER ... @ main.rs × @ lib.rs
 SERVER
  src
   bin
    main.rs
    lib.rs
  target
  404.html
  Cargo.lock
 Cargo.toml
 hello.html

src > bin > @ main.rs
use server::ThreadPool;
use std::fs;
use std::io::prelude::*;
use std::net::TcpListener;
use std::net::TcpStream;
use std::thread;
use std::time::Duration;

fn main() {
    let listener = TcpListener::bind("127.0.0.1:7878").unwrap();
    let pool = ThreadPool::new(4);

    for stream in listener.incoming().take(2) {
        let stream = stream.unwrap();

        pool.execute(|| {
            handle_connection(stream);
        });
    }

    println!("Shutting down.");
}

fn handle_connection(mut stream: TcpStream) {
    let mut buffer = [0; 1024];
    stream.read(&mut buffer).unwrap();

    let get = b"GET / HTTP/1.1\r\n";
    let sleep = b"GET /sleep HTTP/1/1\r\n";

    let (status_line, filename) = if buffer.starts_with(get) {
        ("HTTP/1.1 200 OK", "hello.html")
    } else if buffer.starts_with(sleep) {
        thread::sleep(Duration::from_secs(5));

My -

Rust creates and others resources : benchmarking

01/24/22

Today, I'm looking at all of the resources Kevin sent me to get familiar with.

1. Benchmarking - run program to assess a performance by running tests for it.
I'm going through tutorial on <https://github.com/criterion/criterion.rs/>

Q: what is the standard benchmark harness ???

Procedure:

- 1) Create a simple fibonacci program :

```
main.rs src 1, U main.rs ~/.../berkmark-criterion-pract... U • @
Users > veronikakitsul > Desktop > TAP-research > rust > benchmark-criterion
1 fn main() {
2     fibonacci(50);
3 }
4
5 fn fibonacci(n: u64) -> u64 {
6     match n {
7         0 => 1,
8         1 => 1,
9         n => fibonacci(n-1) + fibonacci(n-2),
10    }
11 }
```

- 2) Add dependency to Cargo.toml :

[dev-dependencies]
criterion = "0.3"

[[[bench]]]

name = "my_benchmark"
harness = false

- 3) run cargo bench with the code in "project-name"/benchmarks/my_benchmark.rs

fails!!! → avoided Kevin can't find how to fix

01/24/22 bkh

Rust - crypto crate

01/24/22

I will ^{try} to work with Rust "crypto" crate today.

To install: add "rust-crypto = "["]0.2"
to [dependencies] in Cargo.toml
and
extern crate crypto;
to root

Okay but I don't understand how to use it? And I can't find any sources on how to do it either, so I will ask Kevin on wednesday.

01/24/22

my ↪

Mentor meeting 01/26/2022: Rust networking + crypto 01/26

how long does it take to do
specific encryptions: hybrid, public-key, secret-key ?

Run benchmarks?

I can do mobile app skeleton.

Running the MPC lib

→ Docker image creation

My next to-dos:

- run different encryptions
- create their benchmarks
- keep learning Rust

Rust

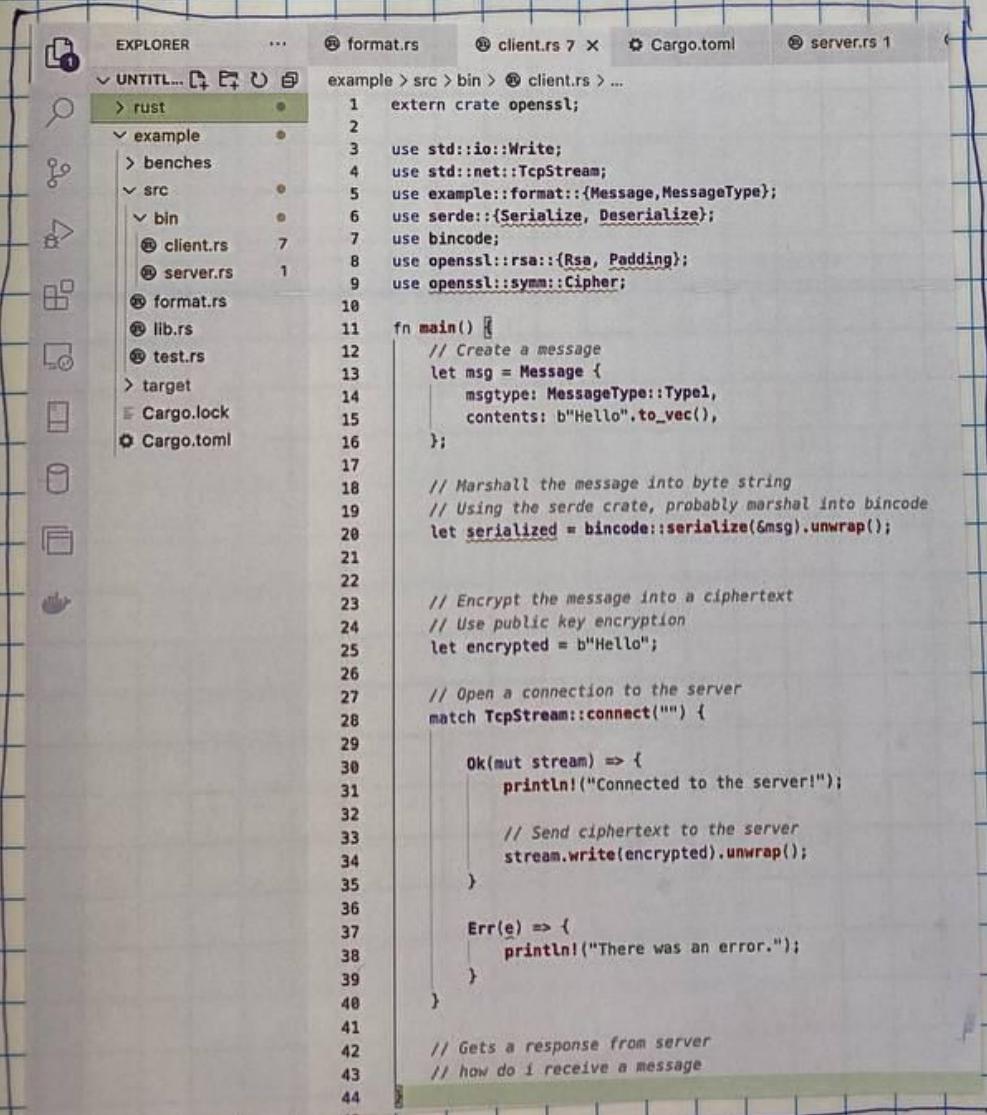

01/26

Creating a single host server: marshal, encrypt-decrypt 01/31

Today, I need to learn to marshal (serialize) data to uniformly transmit it. Because I will transmit a struct data via server, I need to make sure it will be read properly.

To do that, I use serde crate.

- 1) Do a lot of research on the web to find some fitting examples.
- 2) Realized I have to marshal struct into bytes.
- 3) see code attached:

```

EXPLORER      ...  @ format.rs  @ client.rs 7 X  * Cargo.toml  @ server.rs 1
example > src > bin > @ client.rs > ...
1  extern crate openssl;
2
3  use std::io::Write;
4  use std::net::TcpStream;
5  use example::format::{Message, MessageType};
6  use serde::{Serialize, Deserialize};
7  use bincode;
8  use openssl::rsa::Rsa;
9  use openssl::symm::Cipher;
10
11 fn main() {
12     // Create a message
13     let msg = Message {
14         msctype: MessageType::Type1,
15         contents: b"Hello".to_vec(),
16     };
17
18     // Marshall the message into byte string
19     // Using the serde crate, probably marshal into bincode
20     let serialized = bincode::serialize(&msg).unwrap();
21
22
23     // Encrypt the message into a ciphertext
24     // Use public key encryption
25     let encrypted = b"Hello";
26
27     // Open a connection to the server
28     match TcpStream::connect("") {
29
30         Ok(mut stream) => {
31             println!("Connected to the server!");
32
33             // Send ciphertext to the server
34             stream.write(encrypted).unwrap();
35         }
36
37         Err(e) => {
38             println!("There was an error.");
39         }
40
41
42         // Gets a response from server
43         // how do i receive a message
44     }
}

```

client.rs

Code is running with no mistakes, albeit it's not useful yet.

`Cargo.toml` configurations to make two files connect 01/31

`Cargo.toml` file shows all configurations, packages versions, settings for imported crates, and paths to files to run them properly.

From previous page on marshaling, these are the configurations I ended up with:

```

EXPLORER      format.rs    client.rs 7   Cargo.toml
UNTITLED (WORKSPACE)
> rust
< example
> benches
< src
  < bin
    @ client.rs 7
    @ server.rs 1
  @ format.rs
  @ lib.rs
  @ test.rs
> target
@ Cargo.lock
@ Cargo.toml

example > Cargo.toml
1 [package]

Buff - 01/31/2022

Mentor Meeting 02/02 : UPKE, FFI, meetings logistics, MPC 02/02

- try to do Upke encryption
- Mobile code and server → all good because it's through network
- Rust and C++ → foreign function interface
- Generate secure keys? → Upke lib?
or maybe another library
- Meetings in-person: Mon, Wed, Fri would be best for Kevin
- MPC library setup via docker:
 - 1) git clone cmp repo
 - 2) docker build in the folder
 - 3) docker run to run the image
 - 4) execute tests with ./run ./bin/test-bit

more useful examples to follow from Kevin.
- Veronika! background and introduction complete more.

by 02/02/2022

HPKE hybrid encryption

02/03

Today, I will try to do hpke hybrid encryption that I will need to do for my TAP.

There's no decent documentation of it, so I'm looking for examples on the web.

Found 2 examples: one on github and one on docs.rs

However, none of them fits perfectly for what I'm trying to do, so I'm combining them and looking at compiler feedback to fix mistakes.

As of now, I have so many mistakes, but I'll try to fix them as I read more on it and hpke.

The code I ended up today with:

```

EXPLORER      ...  @ client.rs 8, M X  @ Cargo.toml M  @ server.rs 1, M
EXAMPLE
> benches
src
  > bin
    > client.rs 8, M
    > server.rs 1, M
  @ format.rs
  @ lib.rs
  @ test.rs
> target
  Cargo.lock M
  Cargo.toml M

src > bin > @ client.rs > ...
1, use std::io::Write;
2, use std::net::TcpStream;
3 use example::format::Message, MessageType;
4 use serde::{Serialize, Deserialize};
5 use bincode;
6 use rand::prelude::*;
7 use hpke::{
8     aead::AeadTag, ChaCha20Poly1305,
9     kdf::HkdfSha384,
10    kem::X25519HkdfSha256,
11    Deserializable, Kem as KemTrait, OpModeR, OpModeS, Serializable,
12 };
13
14
15
16 fn main() {
17     // Create a message
18     let msg = Message {
19         msgtype: MessageType::Type1,
20         contents: b"Hello".to_vec(),
21     };
22
23     // Marshall the message into bincode with Serde
24     let serialized = bincode::serialize(&msg).unwrap();
25
26
27     // Encrypt the message into a ciphertext by hybrid encryption
28     type Kem = X25519HkdfSha256;
29     type Aead = ChaCha20Poly1305;
30     type Kdf = HkdfSha384;
31     let mut csprng = StdRng::from_entropy();
32     let info_str = b"first message to the sever";
33     let server_pk = b"afefejojTajvodha3795u9";
34
35     let (encapsulated_key, mut encryption_context) = hpke::setup_sender::<Aead, Kdf, Kem, _>
36                                         (&OpModeS::Base, &server_pk, info_str,
37                                         &mut csprng).expect("invalid server pubkey!");
38
39     let aad = b"First encrypted message";
40     let mut ciphertext = serialized.to_vec();
41     let tag = encryption_context.seal_in_place_detached(&mut ciphertext, aad).expect("encryption failed!");
42
43     // Open a connection to the server
44     match TcpStream::connect("") {
45
46         Ok(mut stream) => {
47             println!("Connected to the server!");
48
49             // Send ciphertext to the server
50             stream.write(&ciphertext).unwrap();
51         }
52
53         Err(e) => {
54             println!("There was an error.");
55         }
56     }

```

Buff 02/03

Server.rs → listening for connection on the loop 02/03

Writing up server.rs looks like more work than client.rs. I need to listen to connections on the loop as the first step, which is what I'm planning to do today.

The code that did not give mistakes at build time:

```

EXPLORER ... format.rs client.rs Cargo.toml server.rs 1
UNTITLED... > rust > example > src > bin > server.rs > ...
> benches
> src
> bin
  > client.rs 7
  > server.rs 1
  > format.rs
  > lib.rs
  > test.rs
> target
E Cargo.lock
Cargo.toml

use std::net::TcpListener;
use std::thread;

fn main() {
    let listener = TcpListener::bind("").unwrap();
    // Listen for connections on a loop
    for stream in listener.incoming() {
        let stream = stream.unwrap();

        thread::spawn(move|| {
            // decrypt a message with a key
            // When it gets connection, decrypt message
            // Unmarshall back to message struct
            // Do something with the message
        });
    }
    drop(listener);
}

```

need to
build
thread pool

so
works.

tryf. 02/03/2022

HPKE encryption → successful

02/13

Today I continue working on encrypting a message with HPKE crate.

I was able to do a successful encryption by following github.com/r0zbb/crust-hpke/blob/master/examples/client-server.rs and fixing mistakes with compile time. Here's the code from today:

```
client.rs 8, M × Cargo.toml M server.rs 1, M
src > bin > @ client.rs > ...
1 use std::io::Write;
2 use std::net::TcpStream;
3 use example::format::{Message, MessageType};
4 use bincode;
5 use rand::prelude::*;
6 use hpke::*;
7     aead::(AeadTag, ChaCha20Poly1305),
8     kdf::HkdfSha384,
9     kem::X25519HkdfSha256,
10    Deserializable, Kem as KemTrait, OpModeR, OpModeS, Serializable,
11  };
12
13 type Kem = X25519HkdfSha256;
14 type Aead = ChaCha20Poly1305;
15 type Kdf = HkdfSha384;
16
17 const INFO_STR: &[u8] = b"example session";
18
19 // initialize the server with a key pair
20 fn server_init() -> (<Kem as KemTrait>::PrivateKey, <Kem as KemTrait>::PublicKey) {
21     let mut csprng = StdRng::from_entropy();
22     Kem::gen_keypair(&mut csprng)
23 }
24
25 fn encrypt_msg(
26     msg: &[u8],
27     aad: &[u8],
28     server_pk: &<Kem as KemTrait>::PublicKey, ) -> (<Kem as KemTrait>::EncappedKey, Vec<u8>, AeadTag<Aead>) {
29     let mut csprng = StdRng::from_entropy();
30
31     // encapsulate a key and use the resulting shared secret to encrypt a message
32     // encrypt with AEAD context
33     let (encapsulated_key, mut sender_ctx) = hpke::setup_sender::<Aead, Kdf, Kem, _>
34         (&OpModeS::Base, &server_pk, INFO_STR,
35          &mut csprng).expect("invalid server pubkey!");
36
37     // seal in place will encrypt the plaintext in place if success
38     let mut msg_copy = msg.to_vec();
39     let tag = sender_ctx.seal_in_place_detached(&mut msg_copy, aad).expect("encryption failed!");
40
41     let ciphertext = msg_copy;
42     println!("ciphertext: {:?}", ciphertext);
43     // return
44     (encapsulated_key, ciphertext, tag)
45 }
46
47 fn main() {
48     // set up the server
49     let (server_privkey, server_pubkey) = server_init();
50
51     // Create a message
52     let msg = Message {
53         msgtype: MessageType::Type1,
54         contents: b"Hello".to_vec(),
55     };
56
57     let aad = b"First encrypted message";
58
59     // Marshall the message into bincode
60     let serialized: Vec<u8> = bincode::serialize(&msg).unwrap();
61     // looks good
62     println!("serialized: {:?}", serialized);
63
64     let (encapsulated_key, ciphertext, tag) = encrypt_msg(&serialized, aad, &server_pubkey);
65     let encapsulated_key_bytes = encapsulated_key.to_bytes();
66     let tag_bytes = tag.to_bytes();
67 }
```

Introduction section, Title

02/14

Today, I am planning on working with direct paper writing.

For the fair that is coming up soon I need to turn in a coherent paper, so I will work on the Introduction part now.

Another important thing I need to devise is paper's name and TAP's name.

for paper, one idea is! „IFTTT alternative:

trigger - Action Platform based on Multi - Party Computation Garbled Circuits and — “

One of the most important things for my background is to find a compelling example showing the TAP usage. One interesting one could be „Post new emails received in Gmail to Facebook page“ from real Zappier applets.

Also found more papers about market analysis of other TAPs and their security flaws.

I feel like my Introduction is mostly done by now, just needs editing. Also will look at Lauren's and Brian's comments.

Bailey

server.rs → server TCP connection, decryption

02/17

Today, I'm trying to build a TCP server to connect a client to it.

I also need to create a decryption function to decrypt a marshalled message.

Here's what I was able to accomplish today:
There are some mistakes, but I know how to fix most of them, just don't have the time!

```

example > src > bin > @server.rs ...
1 use std::net::(TcpListener, TcpStream, Shutdown);
2 use std::thread;
3 use std::io::(Read, Write);
4 use hkdf::{
5     aead::(AeadTag, ChaCha20Poly1305),
6     Kdf::HkdfSha384,
7     Kms::X25519HdSha256,
8     Deserializable, Kem as KemTrait, OpModeR, Serializable,
9 };
10
11 fn decrypt_msg(
12     server_sk_bytes: &[u8],
13     encapsulated_key_bytes: &[u8],
14     ciphertext: &[u8],
15     aad: &[u8],
16     tag_bytes: &[u8],
17 ) -> Vec<u8>;
18
19 let server_sk = <Kem as KemTrait>::PrivateKey::from_bytes(server_sk_bytes);
20 expect("could not deserialize server privkey");
21 let tag = AeadTag::Aead::from_bytes(tag_bytes).expect("could not deserialize AEAD tag");
22 let encapsulated_key = <Kem as KemTrait>::EncapsulatedKey::from_bytes(encapsulated_key_bytes);
23 expect("could not deserialize the encapsulated pubkey");
24
25 // decapsulate and derive the shared secret to create AEAD context
26 let mut receiver_ctx = hkdf::setup_receiver::(Aead, Kdf, Kem>
27     (OpModeR::Base, &server_sk, &encapsulated_key, INFO_STR).expect("failed to set up receiver!");
28
29 let mut plaintext = ciphertext.to_vec();
30 receiver_ctx.open_in_place_detached(&mut plaintext, aad, &tag).expect("invalid ciphertext");
31
32 plaintext
33
34
35 fn handle_client(stream: TcpStream) {
36     let mut data = [0 as u8; 2000];
37     while match stream.read(&mut data) {
38         Ok(size) => {
39             decrypt_msg(data);
40             true
41         }
42         Err(e) => {
43             println!("An error occurred, terminating connection with {}", stream.peer_addr().unwrap());
44             stream.shutdown(Shutdown::Both).unwrap();
45             false
46         }
47     } {}
48 }
49
50 fn main() {
51     let listener = TcpListener::bind("127.0.0.1").unwrap();
52
53     // pass key
54
55     // Listen for connections on a loop
56     for stream in listener.incoming() {
57         match stream {
58             Ok(stream) => {
59                 println!("New connection: {}", stream.peer_addr().unwrap());
60                 thread::spawn(move || {
61                     handle_client(stream);
62
63                     // decrypt a message with a key
64
65                     // when it gets connection, decrypt message
66
67                     // Unmarshall back to message struct
68
69                     // Do something with the message
70
71                     });
72                 }
73                 Err(e) => {
74                     println!("Error: {}", e)
75                 }
76             }
77             drop(listener);
78         }
79     }
80 }
```

Report: writing out most parts; design, background 02/21

Today, I met with Kevin to write out the report parts because it's due shortly.

I finished the background section's subsections on Trigger-Action Systems, Market Analysis by the paper Zheng has sent me, and on Multi-Party Computation.

I think I need to write more on the gridded circuit part.

Kevin worked more closely with the overview and goals, design, and evaluation.

I have also drafted an abstract.

I will also need to add credits to Ms. Lohwater and STEM Fellowship, why we chose Beast, add on Related Work, and edit other parts as well.

I also think that I need more extensive literature review to add credibility.

02/21
My
